

# Forecasting systems in Russia: current status and development

E.Astakhova, Hydrometcentre of Russia

with contributions of M.Tsyruльников,  
M.Tolstykh, I.Rozinkina, G.Rivin,  
D.Kiktev, P.Svirenko, M.Shatunova and  
many others

WGNE29, Melbourne, Australia  
March 2014

# ***Computer facilities at Roshydromet (WMC Moscow)***

<b>Computer</b>	<b>Vendor (country)</b>	<b>Rpeak, TFlops</b>	<b>cores/ cores per node</b>
SGI Altix 4700	SGI(USA)	11	1664/128
SGI Altix ICE8200	SGI(USA)	16	1408/8
RSK Tornado	RSK(Russia)	35	1152/12
SGI Altix ICE-X	SGI(USA)	14	720/20
SGI Altix UV2000	SGI(USA)	2	96/96

***Modification of computer system is planned  
in 2015 (~1 PFlops)***

# **Data Assimilation at the Hydrometcenter of Russia (RHMC)**

## **1. DAS based on variational/hybrid approach**

*M Tsyurulnikov, P Svirenko, M Gorbunov, D Gayfulin, A Ordin, A Rakitko*

**Operational global DAS**

**Research regional DAS**

*2. Experimental ensemble assimilation system for SL-AV global model (LETKF)*

*A. Shlyayeva, V. Rogutov, V. Mizyak, M. Tolstykh*

# Global 3D-Var

= based on a spatial-auto-regression covariance model. The model is highly parameterized -- with the intention to be used in an EnVar scheme

= assimilated satellite obs types: AMSU-A, MHS, AMV (Geo, Polar, Leo-Geo), scatterometry (ASCAT, OSCAT), radio-occultation (COSMIC, GRAS, GRACE).

= 3D-Var is working in real time both with the external background (6-h GFS forecast) and in the cycling mode with the RHMC semi-Lagrangian model SL-AV.

## *PLANS*

- A hybrid EnVar scheme: development has started
- Hyper-spectral satellite data.
- GNSS ZTD satellite data.
- Account of satellite error correlations.

# Satellite data assimilation

**Collaboration with Environment Canada (P.Houtekamer and H.Mitchell) is underway on a technique aimed at optimal use of satellite observation-error correlations.**

**The proposed technique accounts for satellite error correlations without explicitly treating non-diagonal covariance matrices.**

# H500. 20N-90N. RMSE vs forecast lead time

## SL-AV is orange (RUMS12)

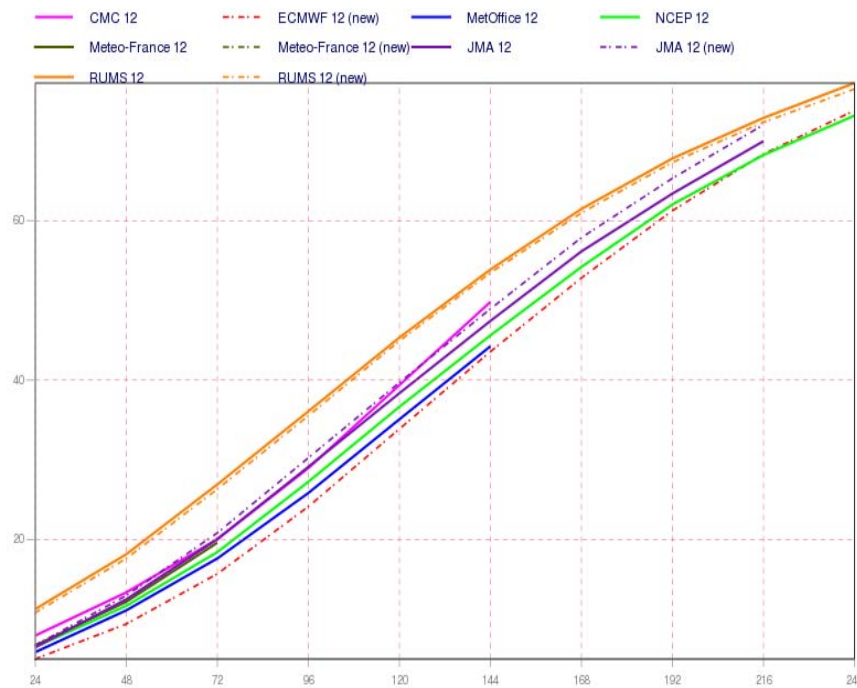

(from <http://apps.ecmwf.int/wmolcdnv/> )

Date: 201306-201308 RMSEF 500 hPa z/n.hem/analysis

Jun-Aug 2013

Date: 201206-201208 RMSEF 500 hPa z/n.hem/analysis

Jun-Aug 2012

**Operational implementation of 3D Var improved the scores.  
The prognostic model is almost the same as a year before**

# Regional 3D-Var

= based on the global 3D-Var scheme (stretched geometry)

= Doppler radar radial wind data assimilation: development underway.

= Works in the experimental mode over two domains: Sochi (2.2 km grid) and Siberia (14 km grid) with COSMO-Ru model.

## PLANS

- Switch to hybrid – after the global EnVar is ready.
- Assimilation of radar winds (and, later, reflectivities)
- Account of radar reflectivities error correlations.

## Regional 3D-Var with COSMO (Siberian region): RMS error of 6-h COSMO forecasts (14 km resolution) started from assimilated analyses (averaging for the period 1-12 December 2013)

Configuration	H, m	T, K	U, m/s	Rel.Hum, %
<b>NoOBS Downscaling)</b> (Pure	<b>20.5</b>	<b>2.52</b>	<b>2.76</b>	<b>22.1</b>
<b>Interpolated DWD analysis</b> global	<b>16.9</b>	<b>2.40</b>	<b>2.42</b>	<b>21.4</b>
<b>Regional cyclic 3D- Var: <u>without AMSU</u></b>	<b>18.0</b>	<b>2.44</b>	<b>2.56</b>	<b>20.3</b>
<b>Regional cyclic 3D- Var: <u>with AMSU</u></b>	<b>17.8</b>	<b>2.42</b>	<b>2.55</b>	<b>20.3</b>

→ The effect is bigger than for Sochi -- because of more observations per grid point assimilated here.

## ***Experimental ensemble assimilation system for SL-AV global model***

- **Scheme: LETKF** [Hunt et al, 2007] **with multiplicative and additive inflation**
- **Assimilation for the global SL-AV model (0.9°x0.72° lon-lat, 28 levels)**
- **Observations assimilated currently: synops, radiosondes, satobs, ships, aireps.**
- **Soil analysis [Giard, Bazile, 2000] in the assimilation cycle, separate analysis for T2m and RH2m**
- **The system works stably, results in [Shlyueva et al., Russ. J. Numer. An. & Math. Mod. 2013]**
- **Current work: implement height reassignment scheme for AMVs**
- **Future plans: implementation of SPPT scheme in the model, assimilation of AMSU observations**

Authors: A.Shlyueva, V.Rogutov, V.Mizyak, M.Tolstykh

# Global modeling

- 2 global models (SL-AV; spectral )
- Global ensemble prediction system: 14 members, breeding, based on T169L31 and SL-AV global models –on operational trials, no changes in 2013, verification scores provided to the Lead Centre on Verification of Ensemble Prediction Systems <http://epsv.kishou.go.jp/EPsv/>

# The global SL-AV model

*Semi-Lagrangian vorticity-divergence dynamical core of own development (Tolstykh), mostly ALADIN/LACE parameterizations.*

- Operational medium-range fcst version: 0.9x0.72 deg lon/lat, 28 levels
- Seasonal forecast version: 1.4x1.1 deg lon/lat, 28 levels

*Nearly the same physics for medium-range and seasonal versions*

- **A new version:** 0.225x(0.18-0.23) deg, 51 levels, improved physics

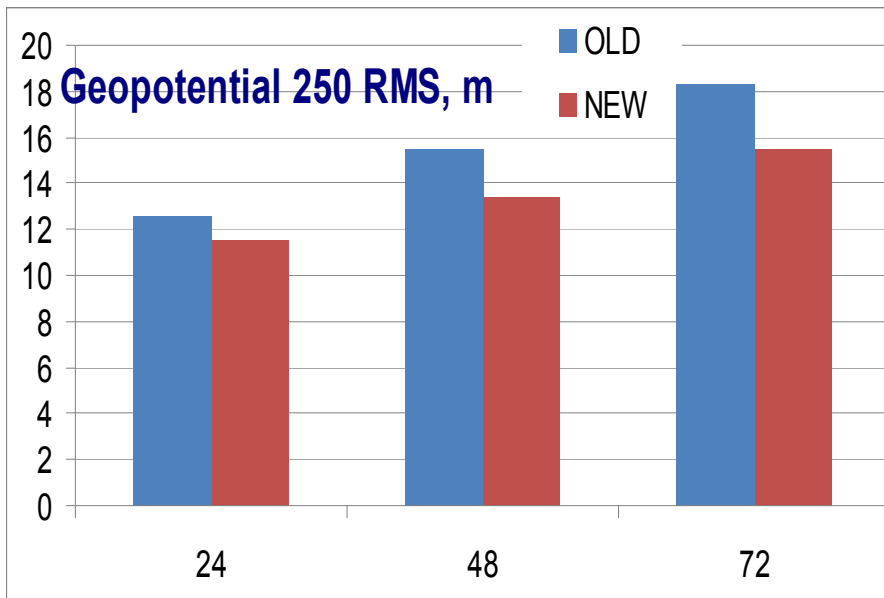

**Developments since last WGNE session (included in the new version)**

- climatic aerosols distribution (GISS climatology)
- modified cloud parameterization (ALARO/LACE developments)
- RRTM LW radiation - INM RAS multilayer soil model
- Improved effect of fresh snow albedo

# Operational version (0.9°x0.72°, 28 levs, **OLD**) and new version (0,225°x0,18°, 51 levs, **NEW**) of the SL-AV model:

RMS errors for tropics, May-Oct 2013

Role of snow albedo (fresh snow effect).  
Reforecast for Mar 1982 (started at end of Jan  
1982). T2m bias: standard scheme (left),  
modified snow albedo (right) (A.Yurova)

# Global SL-AV model: Plans for further development

- Implement hybrid vertical coordinate instead of sigma
- Implement RRTM-G both LW and SW radiation with Monte-Carlo cloud simulator
- Implement ozone cycle (mass-conservative SL advection is ready)
- Convert current med-range model version (0.9x0.72, 28 levs) into seasonal fcst version

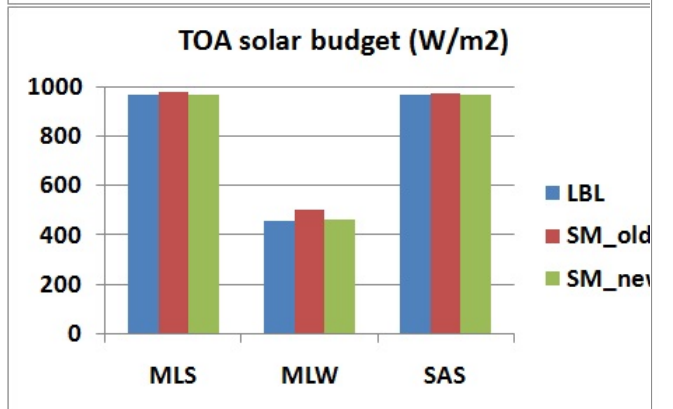

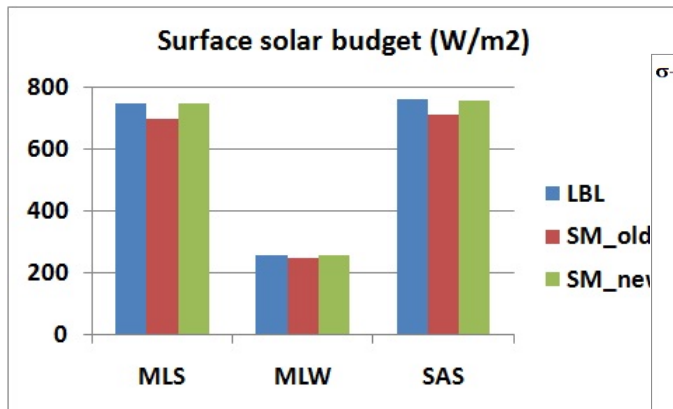

# RHMC Global spectral model

- Spectral vorticity-divergence dynamical core
- Operational: T169L31
- Under pre-operational testing, ready for operational implementation : **T339L31**
- Upgraded radiation block (5  $\rightarrow$ 8 spectral intervals, new data for the gas absorption, 1  $\rightarrow$ 5 types of aerosols)
- Upgraded block of soil heat transfer calculations
- A new algorithm for initialization of snow-cover mask, based on high resolution satellite data

# Implementation of upgraded radiation block (based on detailed Ritter-Geleyn scheme + new parameters for gas absorption and types of aerosols )

*Example of more accurate reproduction of solar heating radiation in the lower and upper parts of the simulated atmosphere*

*The ME evaluation for H500 forecasts for North Hemisphere*

MLS - mid latitude summer MLW - mid latitude winter  
 SAS - sub arctic summer TRP - tropics

red- new, blue- old versions

## Some aspects of T339L31 development

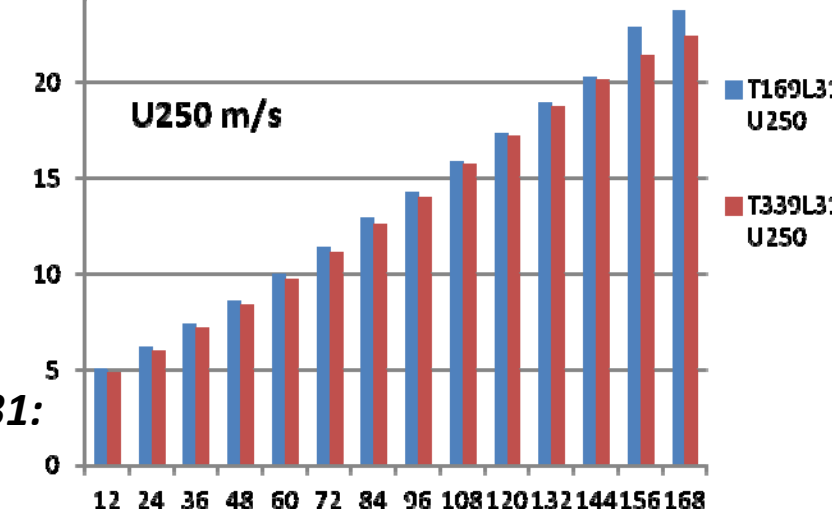

Usage of high resolution satellite data for snow cover

( NOAA multisensor data ) :

snow mask as input for T339L31 for Oct 7, 8,9 2013

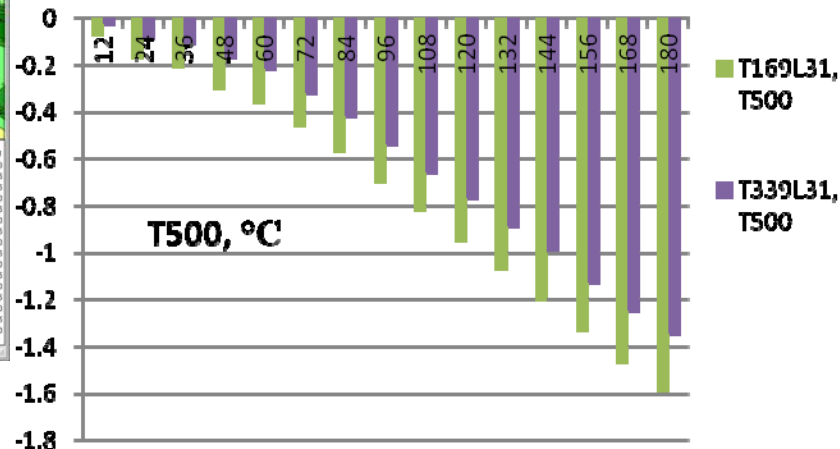

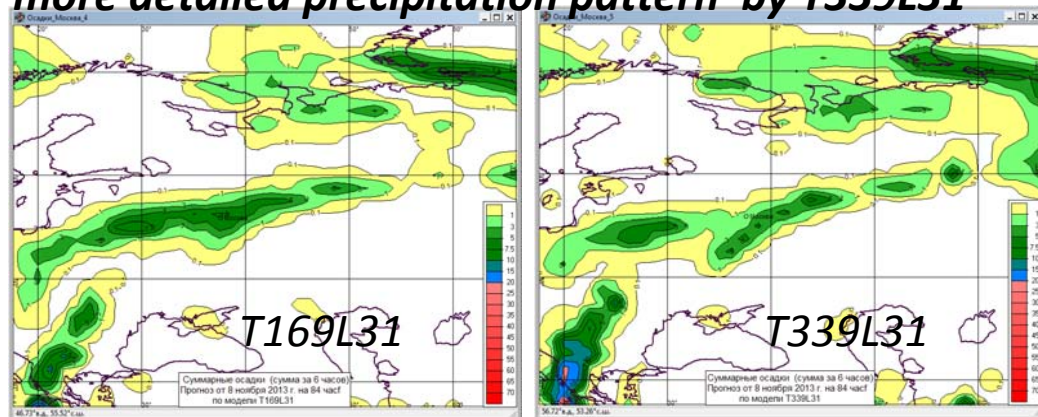

Mean Error : T169L31 vs T339L31

more detailed precipitation pattern by T339L31

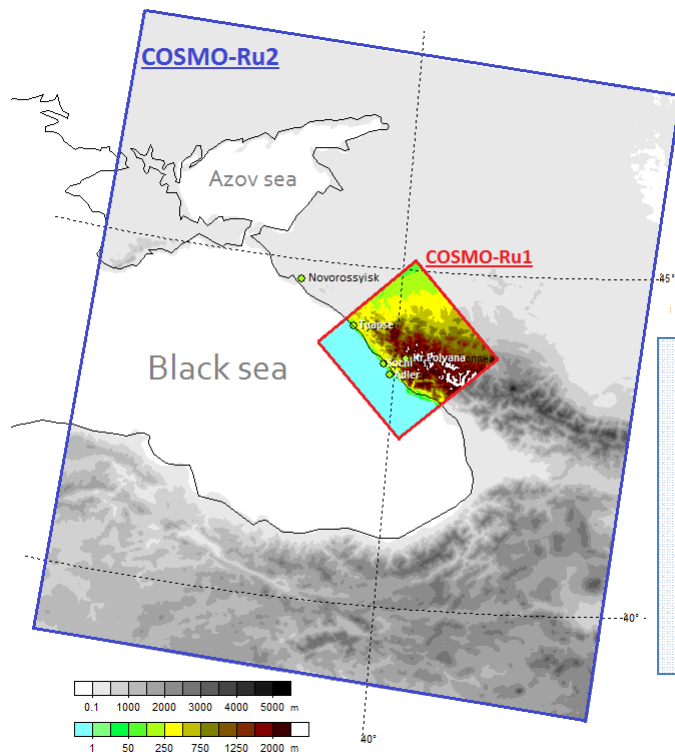

# LAM: COSMO-Ru

**COSMO-Ru7/2/14/13,  
March, 2014**

# High-resolution model COSMO-Ru1

✓ **COSMO-Ru1** model's grid is embedded into the **COSMO-Ru2\_SFO** model's grid from what it gets initial and boundary conditions

## COSMO-Ru2

(for the **Southern Federal Area**)

Domain: 900 km x 1000 km

Grid: 420 x 470 x 50

Space step: **2.2 km**

Time step: 20 s

Lead time: 48 h

IC&BC

## COSMO-Ru1

Domain: 210 km x 210 km

Grid: 190 x 190 x 50

Space step: **1.1 km**

Time step: 5 s

Lead time: 36 h

✓ HMS & AMS data assimilation using *nudging method* for the forecast starts from -6h

✓ HMS & AMS data are using for verification also

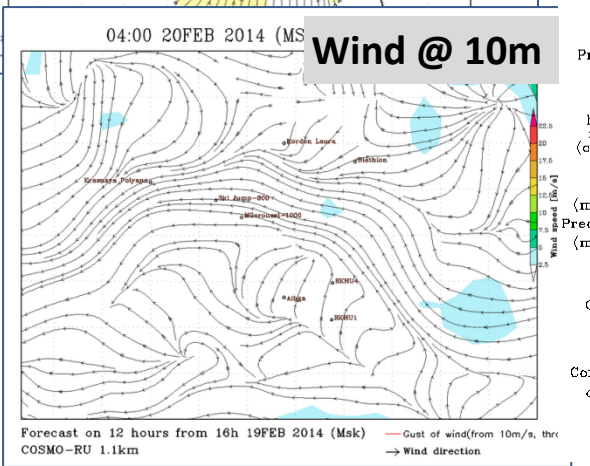

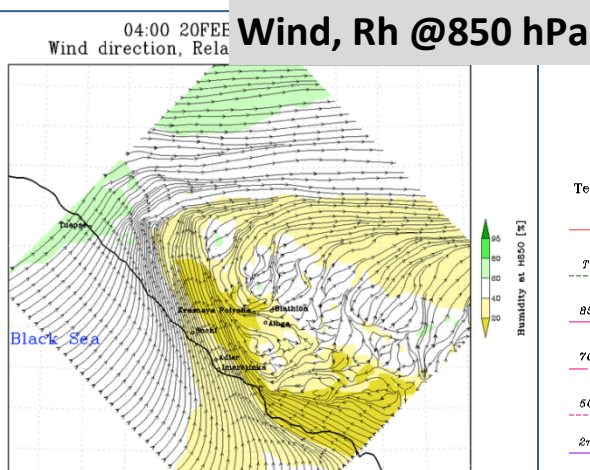

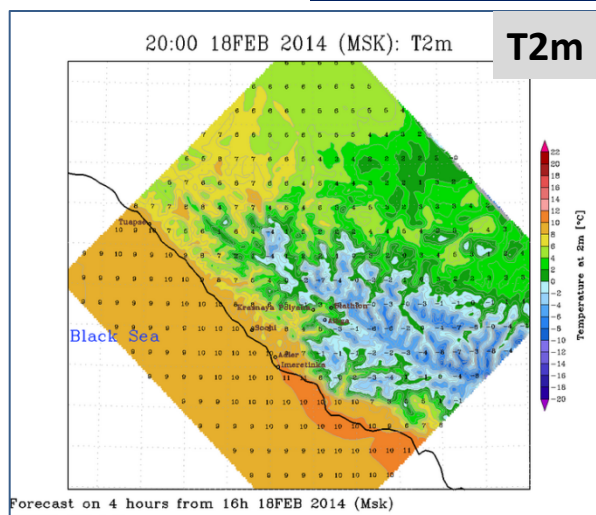

# COSMO-Ru1 for the meteorological support of the SOCHI-2014 Olympic Games

- ✓ COSMO-Ru1 runs in operational mode 4 times per day.
- ✓ Forecast charts and meteograms for pre-specified sites are provided to forecasters and presented on the FROST web site.

COSMO GM2013. E.Astakhova, D.Alferov, A.Montani et al

# FROST-2014 project (FROST = Forecast and Research in the Olympic Sochi Testbed)

## Participants:

- **COSMO,**
- **HIRLAM,**
- **ALADIN,**
- **EC,**
- **FMI,**
- **KMA,**
- **NOAA,**
- **ZAMG**

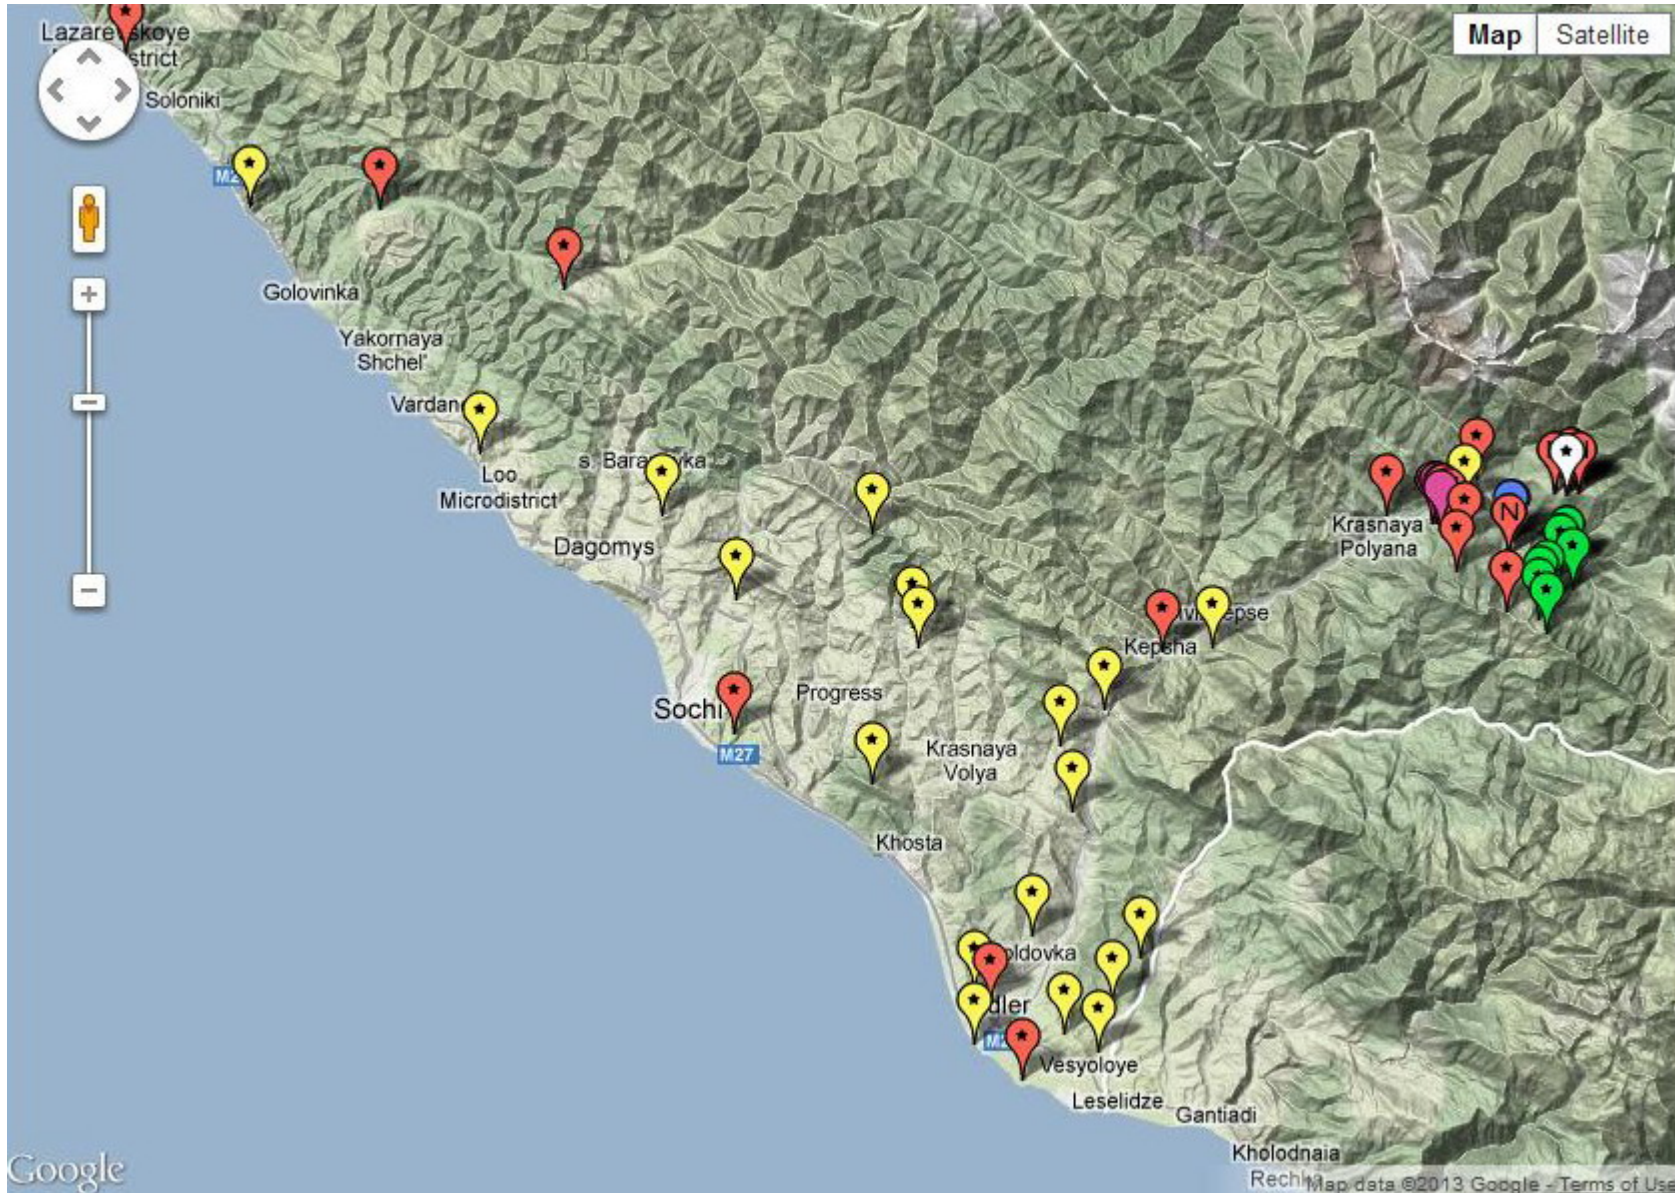

under supervision of the WWRP WGs on Nowcasting, Mesoscale Forecasting, Verification Research

3<sup>rd</sup> meeting of the project participants  
(10-12 April 2013)

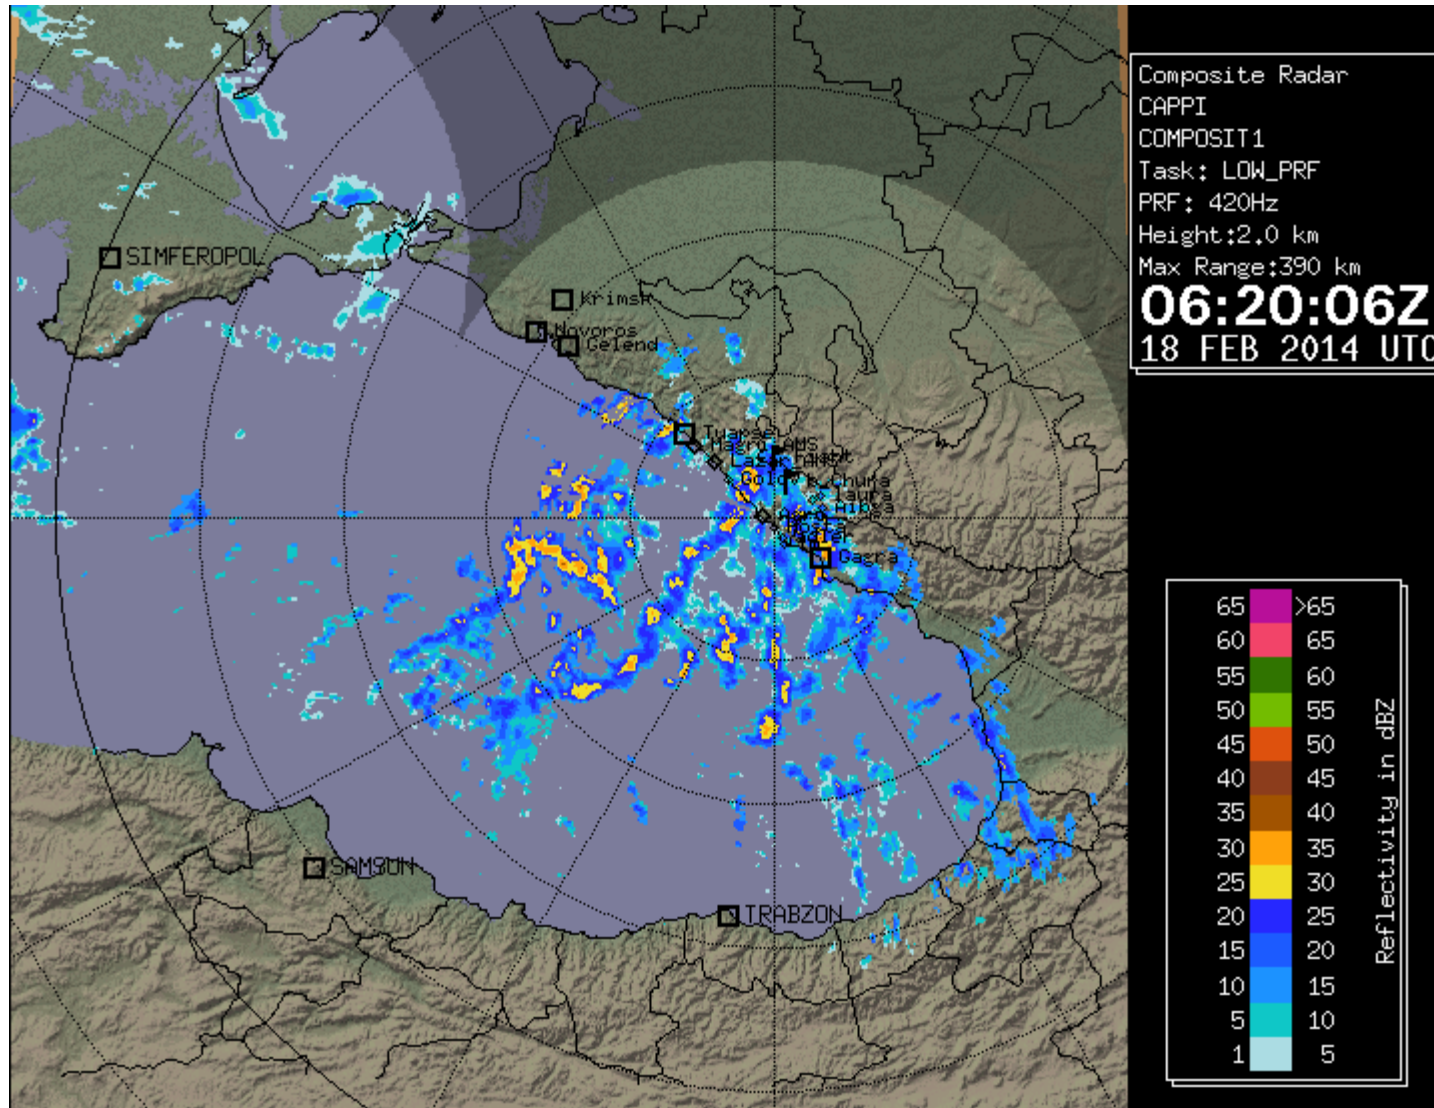

# Today's network of meteorological stations in the region of Sochi

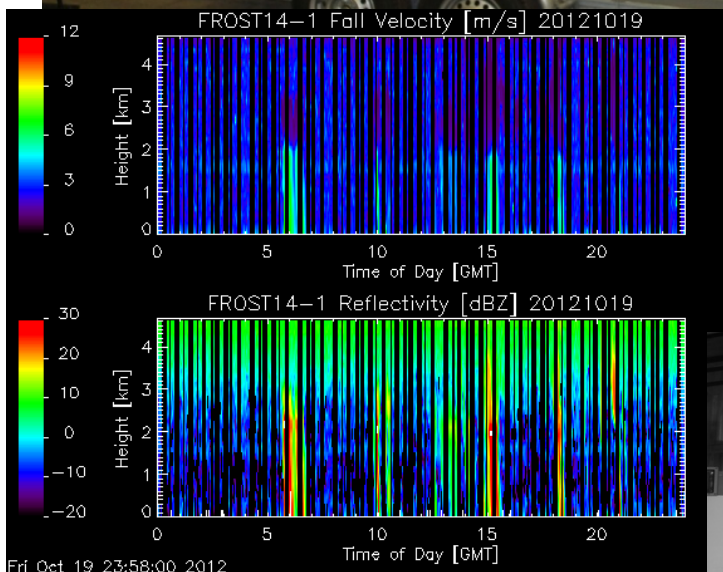

## Vaisala C-band Doppler WRM200 is installed on Akhun mountain in Sochi

Akhun + Samsun (Turkey) + Trabzon (Turkey) + Simferopol (Ukraine) radar composite

# Profilers

- Temperature/Humidity – HATPRO (RPG GmBh, Germany);
- Wind – Scintec-3000 Radar Wind Profiler (Scintec Corp, USA);
- Two METEK Micro Rain vertically pointing Radars (MRR-2)

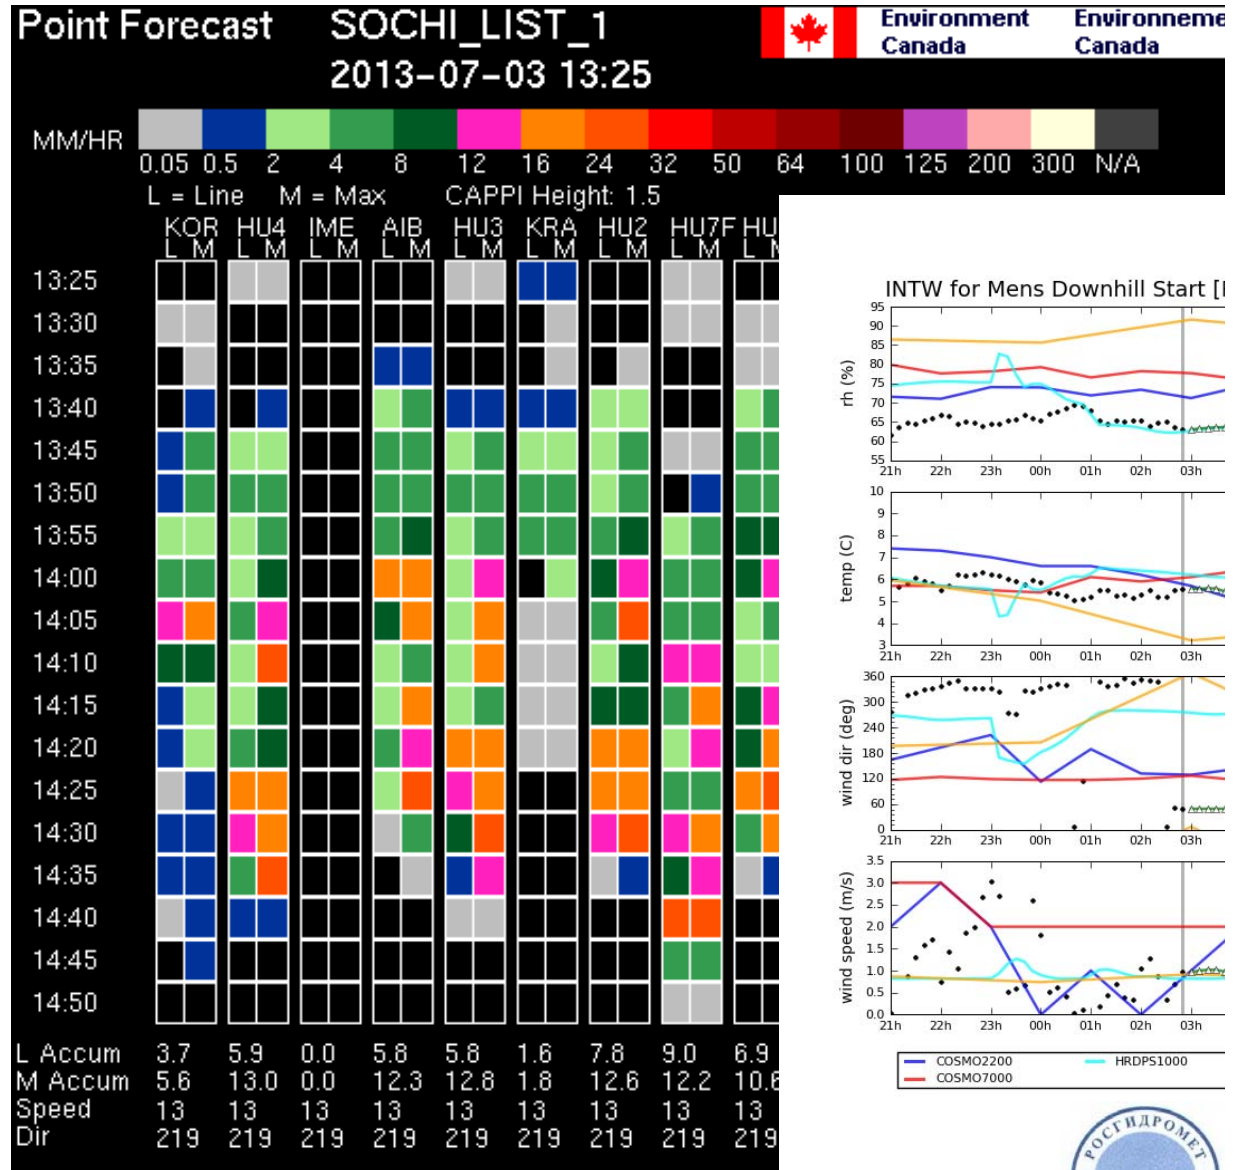

**+ 4 times/day upper air sounding in Sochi**

# Nowcasting project component

Participating systems:

- ABOM,
  - CARDS,
  - INCA,
  - INTW,
  - MeteoExpert,
  - Joint (Multi-system integration);
- + Nowcasting potential of participating NWP systems to be assessed

# Joint Forecast

- F. Woodcock and C. Engel: Operational Consensus Forecasts, Weather and Forecasting, 2005;
- L.X. Huang and G.A. Isaac: Integrating NWP Forecasts and Observation Data to Improve Nowcasting Accuracy, Weather and Forecasting, 2012

$$F(t) = \alpha(t) \cdot O + (1 - \alpha(t)) \sum_i^N \beta_i(t) \cdot (f_i(t) - b_i(t))$$

$F(t)$  – integrated forecast (t – forecast time);

$O$  – last available observation;

$f_i(t)$  – forecast of  $i$ -th participating forecasting system;

$\alpha(t)$ ,  $\beta_i(t)$  - weights;

$b_i(t)$  - bias for  $i$ -th forecasting system

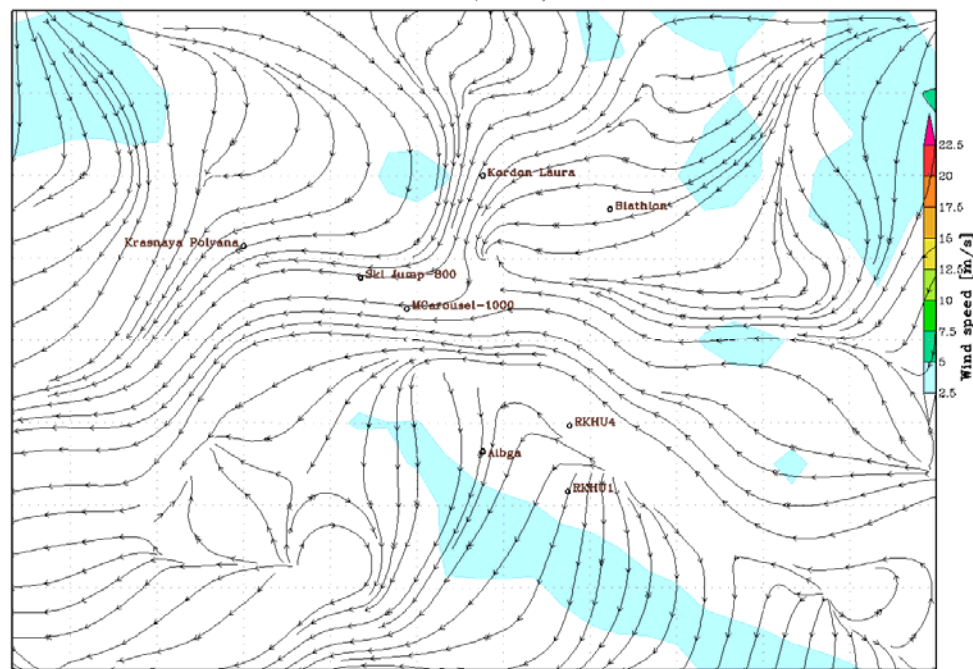

# Deterministic NWP project component

- COSMO-RU with grid spacing 7 km, 2.2 km, 1.1 km;
- GEM with grid spacing 2.5km, 1km, 0.25km;
- NMMB – 1 km;
- HARMONIE - 2.5km;

08:00 19FEB 2014 (MSK): Wind at 10m

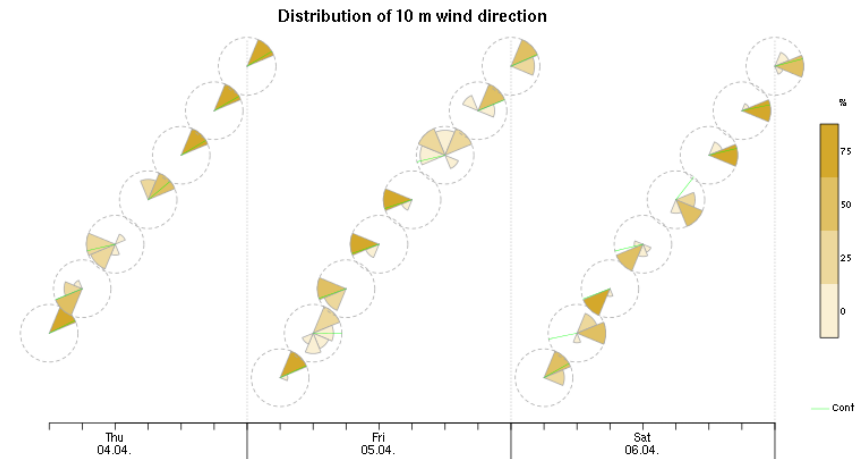

Forecast on 4 hours from 04h 19FEB 2014 (Msk)  
COSMO-RU 1.1km

— Gust of wind(from 10m/s, thro  
→ Wind direction

**Ensemble project component**  
 COSMO-S14-EPS, Aladin LAEF,  
 GLAMEPS, NNMB-7km EPS,  
 COSMO-RU2-EPS,  
 HARMON-EPS

KMA's downscaling of probabilistic forecasts,  
 Poor man's ensemble of deterministic high-resolution models

It is not simple for forecasters to deal with such an amount of information under the operational time constraints  
 => compression of information data feeds is needed

The screenshot shows the 'Forecast charts' section of the FROST-2014 website. It features a navigation menu with 'Observations', 'Forecasts', 'Documents', '3rd FROST-2014 meeting', 'Presentations', 'Library', 'Blog/News', and 'Contacts'. A 'LOG OUT' button is visible on the left. Under 'SPORT VENUES', there are links for weather bulletins for Cross-Country Skiing and Biathlon competitions.

The main content area displays a table of forecast models and their initialization times:

Model	Init time
<input checked="" type="checkbox"/> COSMO2	2013-07-17 18:00:00
<input checked="" type="checkbox"/> COSMO7	2013-07-18 00:00:00
<input checked="" type="checkbox"/> ARPA-EPS	2013-07-17 12:00:00
<input checked="" type="checkbox"/> INCA	2013-07-18 04:00:00

To the right of this table is a Gantt-style chart showing the active periods for each model from July 17th to 21st. The models and their durations are: COSMO2 (blue, Jul 18-19), COSMO7 (red, Jul 18-21), ARPA-EPS (green, Jul 18-20), and INCA (purple, Jul 18-20).

Below the table is a line chart showing temperature (Temp. (C)) over time from July 18th to 21st. The y-axis ranges from 10 to 25 degrees Celsius. The x-axis shows dates and times (12:00). Multiple colored lines represent different forecast models, showing temperature fluctuations. A secondary y-axis on the left shows values 90 and 100, possibly related to humidity or another meteorological variable.

On the right side of the temperature chart, there is a list of weather stations:

- Krasnaya Poliana (Ro...
- RKHU-4
- Solokh-Aul (Roshydrom...
- Imeretinka (Roshydrom...
- Kepsha (Roshydromet)
- Adler-AMSG
- Aibga (Roshydromet)
- Kordon Laura (Roshydr...
- Agrostation Sochi (Rost...
- Freestvle-1080 (IRAM)

At the bottom left, there are two map thumbnails showing geographical locations related to the forecast area.

# Seasonal Forecasting

- Hydrometcentre of Russia is one of the WMO Global Producing Centres (GPC).
- Operational seasonal forecasts with 1-month lead time are issued by the Hydrometcentre of Russia and the Main Geophysical Observatory on the basis of “two-tier” systems. Coupled systems of the Hydrometcentre of Russia and the Main Geophysical Observatory are being tuned and tested.

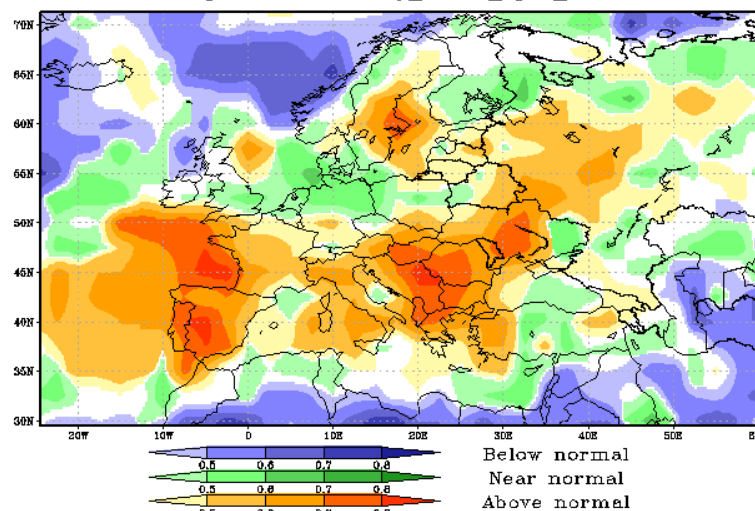

Composite probabilities of categorical forecast outcomes for Precipitation seasonal anomalies. Producer: HMC+MGO  
Forecast period: February\_March\_April\_2014

Composite probabilities of categorical forecast outcomes for T2m seasonal anomalies. Producer: HMC+MGO  
Forecast period: February\_March\_April\_2014

Composite probabilities of categorical forecast outcomes for Precipitation seasonal anomalies. Producer: HMC  
Forecast period: February\_March\_April\_2014

# Subseasonal Forecasting in Roshydromet

- Forecasts of subseasonal variability are issued on weekly basis by the Hydrometcentre of Russia and the Main Geophysical Observatory.

At the moment these forecasts are under operational trial.

- The Hydrometcentre of Russia (GPC-Moscow) is a participant of the Subseasonal to Seasonal Prediction Project (S2S).

At the moment GPC-Moscow model output is being adjusted to the requirements of the S2S project.

- Forecasts of subseasonal variability provided a valuable input for the meteorological support of the Sochi Winter Olympic Games.

Composite probabilities of categorical forecast outcomes for T2m anomalies. Producer: HMC+MGO  
Forecast period - WEEK 1, initial data: 12february 2014

Composite probabilities of categorical forecast outcomes for T2m anomalies. Producer: HMC+MGO  
Forecast period - WEEK 3, initial data: 12february 2014

Composite probabilities of categorical forecast outcomes for T2m anomalies. Producer: HMC+MGO  
Forecast period - WEEK 4, initial data: 12february 2014

# Climate modelling (INM of RAS)

Sensitivity experiment for **quadrupling** of CO<sub>2</sub> was performed with climate model INMCM5 (atmosphere 1.25x1 L128, ocean 0.167x0.125 L40). It is shown that:

1. **Equilibrium sensitivity** for this model is **3.4K**. It is smaller than in any present-day climate model. The reason is decrease of cloud radiation effect that appears rapidly after quadrupling of CO<sub>2</sub> and is almost independent from global warming.

2. Ocean heat uptake in climate model with eddy-resolved ocean is almost the same as in the model INMCM4 (atmosphere 2x1.5L21, ocean 1x0.5L40) that doesn't resolve ocean eddies.

# Most important results

- **Global 3D-Var DAS working both with the external background (6-h GFS forecast) and in the cycling mode with SL-AV**
- **Regional 3D-Var DAS**
- **New SL-AV version with resolution 0.225x0.18 deg, 51 levels and improved physics**
- **T339L31 version with improved physics**
- **COSMO-Ru1 model (1.1 km resolution)**
- **Success of FROST2014 project in providing meteorological support to the SOCHI 2014 Olympic games**

**THANK YOU FOR YOUR ATTENTION!**

**СПАСИБО ЗА ВНИМАНИЕ!**
