Uses of the regional atmosphere land configuration

- Regional model used for convection permitting to convection resolving simulations
- UKV model for Met Office forecasts (forced with time varying SST from AMM15 model).
- London 300m model (research configuration)
- Used by several UM partners (e.g. NIWA, Bureau of Meteorology, MSS)
- Can be used as a relocatable model for crisis areas
- RAL2 had two version RAL-M (for mid-latitudes) and RAL-T for tropics.
- There is also a coupled configuration – not yet operational

Main Science Changes in RAL3

- Bi-modal cloud scheme (*Kwinten van Weverberg*)

Van Weverberg et al., 2021: <https://doi.org/10.1175/MWR-D-20-0224.1> and <https://doi.org/10.1175/MWR-D-20-0230.1>

- based on Smith cloud scheme previously used in mid-latitude RAL
- replaces Smith scheme in RAL2-M and prognostic PC2 scheme in the tropical version RAL2-T

- CASIM multi-moment cloud microphysics scheme (*Adrian Hill, Paul Field, Kalli Furtado*)

Shipway and Hill, 2012 - <https://doi.org/10.5194/acp-18-14253-2018> , Miltenberger et al, 2018 - <https://doi.org/10.5194/acp-18-3119-2018>

- **Cloud AeroSol Interacting Microphysics**
- permits the UM to have single or double moments microphysical capability

- changes to the land surface configuration (*Martin Best*)

- consolidation of global and regional model land surface settings

- stochastic boundary layer perturbations in mid-latitude configuration no longer needed (*Adrian Lock*)

- and many more...

RAL3 science changes

- Bi-modal cloud scheme (*Kwinten van Weverberg*)

Van Weverberg et al., 2021 - <https://doi.org/10.1175/MWR-D-20-0224.1> and <https://doi.org/10.1175/MWR-D-20-0230.1>

- based on Smith cloud scheme previously used in mid-latitude RAL
- replaces Smith scheme in RAL2-M and prognostic PC2 scheme in the tropical version RAL2-T

- CASIM multi-moment cloud microphysics scheme (*Adrian Hill, Paul Field, Kalli Furtado*)

Shipway and Hill, 2012 - <https://doi.org/10.5194/acp-12-14253-2012> . Millerberger et al., 2018 - <https://doi.org/10.5194/acp-18-3119-2018>

- Cloud AeroSol Interacting Microphysics
- permits the UM to have single or double moments microphysical capability

No longer need separate tropical and mid-latitude configurations.

- changes to the land surface configuration (*Martin Best*)

- consolidation of global and regional model land surface settings

- stochastic boundary layer perturbations in mid-latitude configuration no longer needed

- and many more...

Impact of RAL3:

- Exacerbation of existing cold temperature bias
- Improved representation of clouds
- Improved visibility
- Precipitation worse against gauges, improved against radar. Distributions improved.
- Improved representation of convection

▲ RAL3 better
▼ RAL3 worse

Bi-modal cloud scheme helps with better representation of cloud in RAL3

Unified Physics

Develop a Unified Physics configuration for GAL and RAL which includes CoMorph, CASIM and a single cloud scheme. This will be a physical improvement on what's used currently and aims to reduce systematic errors.

- Global & convective-scale model science is unified across timescales in Met Office models.
- However there are a number of differences between global (GAL) and regional (RAL) configurations, most notably:
 - Convection parametrization on vs off
 - Prognostic vs diagnostic cloud scheme
 - McICA in GAL and not RAL and associated radiation differences
 - Land surface and orographic drag differences

Met Office Removing outstanding seams to create a seamless system

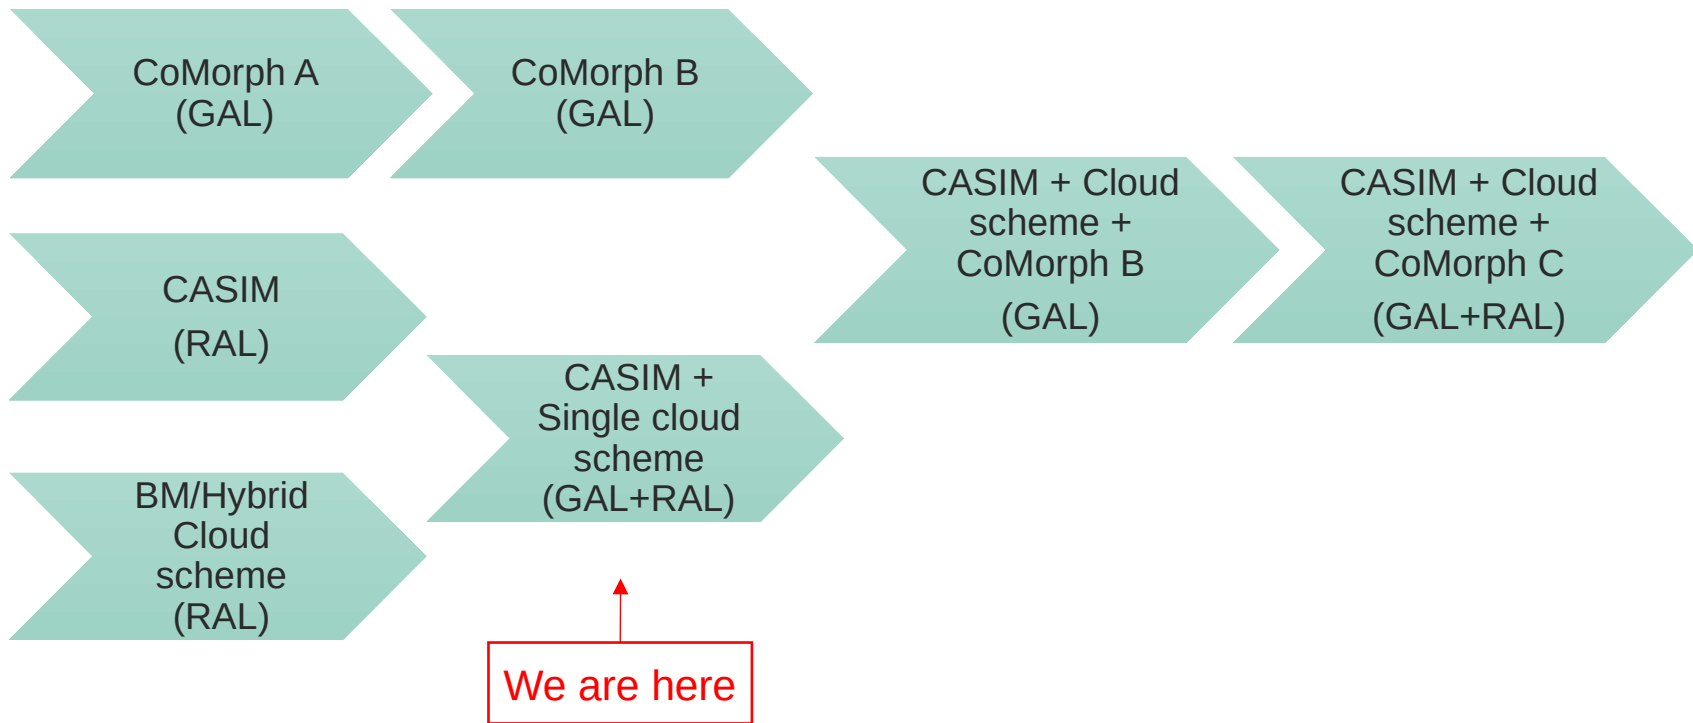

- A scale-aware convection scheme (CoMorph) provides the opportunity to unify GAL and RAL science
- This is desirable because:
 - Plans to run the global model in the convective ‘grey zone’ mean a configuration distinction between parametrized and explicit convection is no longer appropriate.
 - It is increasingly problematic to develop new science (e.g. CoMorph & CASIM) within two significantly different model configurations (end up with different versions of new schemes).
 - The overheads associated with maintaining and testing new science in different configurations in terms of staff and computer time are significant.
 - There are potentially significant benefits for parametrization development (traditional and ML approaches) from having a more unified configuration

Met Office CoMorph convection scheme development

- **CoMorph A:** First formulation for new global convection scheme, developed in 2021; recent revisions to operate with GAL9 physics.
- **CoMorph B:** *In progress*. Also aimed at global (10-100km) resolutions. Targets improving diurnal cycle; aiming for release early 2023.
- **CoMorph C:** Plan is for this to be a scale-adaptive, stochastic version of scheme that can operate down to km scales for inclusion with UP.

Order of work

Summary

- A new regional model configuration (RAL3) with many improvements. First regional model to have same physics in mid-latitudes and tropics
- RAL3 expected to go operational in 2024 on new HPC along with latest global coupled model GC5 (NWP & seasonal).
- Unified physics project aims to implement the same physics in global and regional models:
 - CASIM microphysics
 - Bi-modal cloud
 - COMORPH convection
- A key step towards development of kilometre scale global models.
